

ABSTRACT

1
2 A cable retractor assembly is capable of retracting a cable onto a rotatable reel.
3 The rotatable reel being urged to rotate in a predetermined direction by a biasing force. A
4 moveable actuator when located in a first position is capable of overcoming the biasing
5 force that urges the cable to be wound onto the reel. When the moveable actuator is in a
6 second position, the moveable actuator does not impede the biasing force. A user
7 desiring a length of cable to be unreeled can move the actuator to the second position,
8 extract the desired length of cable by pulling on the cable in excess of the biasing force,
9 and then move the actuator into the first position thereby preventing the cable from being
10 retracted. The cable having conductors that transmit signals from an electrical circuit
11 coupled to a first end of the cable to a speaker located at a second end of the cable. The
12 retractor assembly may be integrated into or detachably secured to a portable electronic
13 device. The retractor assembly allows the user to easily adjust the length of cable
14 between the speaker and the electronic device. A sensor within the cable retractor
15 assembly can detect when the reel rotates or the cable is extracted and thereby signal a
16 coupled communications device to pick up an incoming call. The cable retractor
17 assembly further comprises a pick-up actuator when actuated signals a coupled
18 communications device to pick up an incoming call. The cable retractor comprising
19 terminals to allow a coupled communications device to communicate with other
20 electronic devices without having to decouple the retractor from the communications
